PMA Agile is a component of the Performance Monitoring for Action project and aimed at the subnational level (state, county or city). It builds on the PMA monitoring and evaluation platform and conducts continuous tracking of family planning service delivery and consumption through quarterly public and private health facility surveys and semi-annual client exit interviews. A phone follow-up survey is conducted with consenting female clients four months after their interviews.

PMA Agile monitors the urban areas of three states in Nigeria, Lagos, Kano, and Ogun, and is conducted by the Center for Research, Evaluation Resources and Development (CRERD) and the University of Ibadan, College of Medicine, in collaboration with The Bill and Melinda Gates Institute for Population and Reproductive Health at the Johns Hopkins Bloomberg School of Public Health. This brief covers four quarterly surveys conducted in Lagos from December 2017 to May 2019.

The full results are accessible at site dashboards at pmadata.org/technical-areas/pma-agile. The project receives support from the Bill and Melinda Gates Foundation.

Key highlights from Q1-Q4 SDP surveys in Lagos

- The SDP sample in Lagos is composed of 102 public and 99 private facilities in Q1.
- Staff trained in family planning in both public and private SDPs tend to be nurses and doctors.
- Although public SDPs account for the majority of couple-years of FP protection (CYPs), the methods provided are largely limited to implants, IUDs and injectables. Private SDPs provide CYPs through a wide range of methods that also includes EC, pills and sterilization.
- Across all four quarters, the average number of client visits for implants, injectables, pills, and IUDs remained relatively steady.
- The main contraceptive method sold at private SDPs was male condoms, with an average of 77-167 units per month, followed by emergency contraception, with an average of 25-56 units per month.
- Public SDPs are more likely than private SDPs to have implants and IUDs in stock.
- Public hospitals in our sample reported no stock-out of injectables across all four quarters. Health centers began to experience injectable stock-out in Q3. More than 10% of health posts were out-of-stock of injectables through the first 3 quarters. However, by Q4, no health posts experienced stock-out.
Staff trained in family planning in both public and private SDPs tend to be nurses (54% and 45% respectively), followed by doctors, 24% in public facilities and 29% in private facilities.

### CLIENT VISITS and CONTRACEPTIVE UNITS SOLD

Across all four quarters, the average number of client visits for implants, injectables, pills, and IUDs remained relatively steady. Client visits for condoms experienced more fluctuations across quarters, with an average of 97 visits in Q1 to an average of 66 visits in Q4.

### AVERAGE NUMBER OF CONTRACEPTIVE COMMODITIES SOLD BY PRIVATE SDPS IN PAST MONTH (n=99)

The main contraceptive method sold at private SDPs was male condoms, with an average of 77-167 units per month, followed by emergency contraception, with an average of 25-56 units per month. Reported method sales were higher in Q4 than Q3.
Although public SDPs account for the majority of couple-years of FP protection (CYPs), the methods provided are largely limited to implants, IUDs and injectables.

Private SDPs provide CYPs through a wide range of methods that also includes EC, pills and sterilization.

The estimated CCR ranged over the four quarters, from 26.5% in Q3 to 34.7% in Q4.

While not a direct counterpart, this can be compared to the PMA2020 2018 modern contraceptive prevalence rate of 25.5% among married women age 15-49.
STOCK OUTS
METHODS IN STOCK: FOCUS ON IMPLANTS AND IUDs

Public SDPs are more likely than private SDPs to have implants and IUDs in stock.

PMA AGILE SAMPLE

PMA Agile uses probability sampling methods to select public and private SDPs from master lists of registered health facilities, stratified by type of facility. For each geography, up to 220 SDPs are sampled. The target sample is 100 public and 100 private health facilities, allowing for 10% non-participation. The SDP data are weighted to be statistically representative of the geography. The same panel of SDPs is visited quarterly for a subsequent interview and the weights re-adjusted as needed.

Every other quarter, a client exit survey is conducted by systematically selecting 10 clients per facility. Eligible clients are males aged 18-59 years or females aged 18-49 years. The target sample is approximately 1500-2000 clients. The client data for a given SDP are weighted by the client’s selection probability which is a function of the SDP’s average daily volume of clients and the client sampling interval. The client data are then weighted by the SDP selection probability. Female clients are asked to consent to a phone follow-up approximately four months later when they are asked about continued contraceptive use, switching and satisfaction with services received.
