PMA Agile is a component of the Performance Monitoring for Action project and aimed at the subnational level (state, county or city). It builds on the PMA monitoring and evaluation platform and conducts continuous tracking of family planning service delivery and consumption through quarterly public and private health facility surveys and semi-annual client exit interviews. A phone follow-up survey is conducted with consenting female clients four months after their interviews.

PMA Agile monitors the urban areas of three counties in Kenya, Kericho, Migori and Uasin Gishu, and is conducted by the International Centre for Reproductive Health-Kenya (ICRHK), in collaboration with The Bill and Melinda Gates Institute for Population and Reproductive Health at the Johns Hopkins Bloomberg School of Public Health. This brief covers six quarterly surveys conducted in Migori from December 2017 to January 2020. The full results are accessible at site dashboards at pmdataportal.com/technical-areas/pma-agile. The project receives support from the Bill and Melinda Gates Foundation.

Key highlights from Q1-Q6 SDP surveys in Migori

- The SDP sample in Migori was composed of 101 public and 104 private facilities in Q1.
- Staff trained in family planning in both public and private SDPs in Q6 tended to be community health workers (58% and 32% respectively).
- Across all six quarters, the average number of client visits for implants, IUDs, injectables, EC, and pills experienced minor fluctuations. Client visits for condoms experienced more a major increase in Q3.
- The main contraceptive method sold at private SDPs was male condoms, with an average of 121-242 units per month, followed by emergency contraception, with an average of 43-106 units per month.
- Public and private SDPs account for roughly the same proportion of couple-years of FP protection (CYPs). The methods largely provided by both sectors are implants and IUDs.
- Public SDPs are more likely than private SDPs to have implants and injectables in stock.
- Hospitals saw the greatest improvement in injectable stock status, with more than 10% of public facilities out-of-stock in Q1 - Q4, to no facilities out-of-stock in Q5.
Staff trained in family planning at facilities, Q6

Staff trained in family planning in both public and private SDPs in Q6 tended to be community health workers (58% and 32% respectively), followed by nurses (25% in public SDPs and 27% in private SDPs).

Across all six quarters, the average number of client visits for implants, IUDs, injectables, EC, and pills experienced minor fluctuations. Client visits for condoms experienced more a major increase in Q3.
The main contraceptive method sold at private SDPs was male condoms, with an average of 121-242 units per month, followed by emergency contraception, with an average of 43-106 units per month.

Public and private SDPs account for roughly the same proportion of couple-years of FP protection (CYPs). The methods largely provided by both sectors are implants and IUDs.
METHODS IN STOCK: FOCUS ON IMPLANTS AND INJECTABLES

STOCK OF CONTRACEPTIVE METHODS

PMA Agile uses probability sampling methods to select public and private SDPs from master lists of registered health facilities, stratified by type of facility. For each geography, up to 220 SDPs are sampled. The target sample is 100 public and 100 private health facilities, allowing for 10% non-participation. The SDP data are weighted to be statistically representative of the geography. The same panel of SDPs is visited quarterly for a subsequent interview and the weights re-adjusted as needed.

Every other quarter, a client exit survey is conducted by systematically selecting 10 clients per facility. Eligible clients are males aged 18-59 years or females aged 18-49 years. The target sample is approximately 1500-2000 clients. The client data for a given SDP are weighted by the client’s selection probability which is a function of the SDP’s average daily volume of clients and the client sampling interval. The client data are then weighted by the SDP selection probability. Female clients are asked to consent to a phone follow-up approximately four months later when they are asked about continued contraceptive use, switching and satisfaction with services received.

Public SDPs are more likely than private SDPs to have implants and injectables in stock.

Hospitals saw the greatest improvement in injectable stock status, with more than 10% of public facilities out-of-stock in Q1 - Q4, to no facilities out-of-stock in Q5.

PMA AGILE SAMPLE

PMA Agile uses probability sampling methods to select public and private SDPs from master lists of registered health facilities, stratified by type of facility. For each geography, up to 220 SDPs are sampled. The target sample is 100 public and 100 private health facilities, allowing for 10% non-participation. The SDP data are weighted to be statistically representative of the geography. The same panel of SDPs is visited quarterly for a subsequent interview and the weights re-adjusted as needed.
